

Amazon Product Analysis Dashboard

Project Overview

The Amazon Product Analysis Dashboard project was developed using Excel and Power BI to analyze product performance, customer ratings, discount trends, and category distribution across Amazon products.

The objective of this project was to transform raw product data into meaningful business insights through data cleaning, analysis, visualization, and dashboard development.

Tools Used

- Microsoft Excel
 - Power BI
 - DAX (Data Analysis Expressions)
 - Pivot Tables
 - Data Visualization
-

Dataset Information

The dataset contains Amazon product information, including:

- Product ID
- Product Category
- Product Rating
- Rating Count
- Discount Percentage

A total of 1,465 Amazon products across 212 categories were analyzed

Key Performance Indicators (KPIs)

- Total Products: 1352
 - Average Rating: 4.10
 - Average Discount: 47.69%
 - Total Categories: 212
 - Average Review Count: 18,296
 - Most Represented Category: USB Cables
-

Key Insights

Customer satisfaction is not solely driven by discounts.

High discounts do not guarantee popularity.

USB Cables are the most represented category.

Some highly discounted categories receive lower ratings.

Product count alone does not determine popularity.

Recommendations

Focus on high-rating, high-engagement categories.

Review categories with high discounts but low ratings.

Use discounts strategically rather than relying on them alone.

Dashboard Features

- KPI Cards
 - Total Products
 - Average Rating
 - Average Discount
 - Total Categories
 - Average Review Count
 - Top Categories by Product Count
 - Top Categories by Average Rating
 - Top Categories by Average Discount
 - Discount vs Rating Scatter Plot
 - Insights and Recommendations Section
-

Project Outcome

The dashboard provides a clear overview of Amazon product performance and customer behavior. By combining Excel-based analysis with interactive Power BI visualizations, the project helps identify product trends, evaluate category performance, and support data-driven decision-making.
